KNOTS AND POLYGONS

A recreation - Roy Lisker

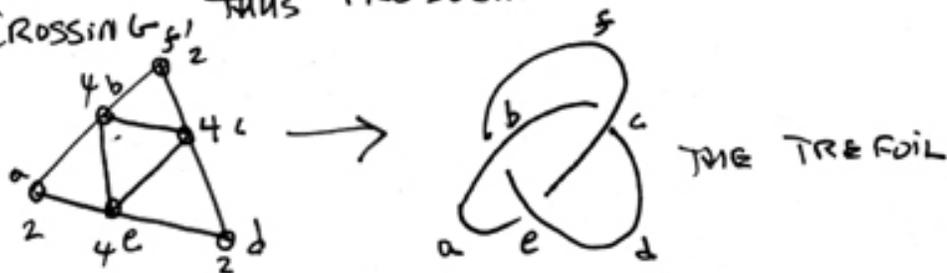

①

I. LET G BE A PLANAR GRAPH. IF THE NUMBER OF EDGES AT EACH NODE IS 2 OR 4, THEN THE VERTICES CAN BE INTERPRETED AS CROSSINGS. IF THE NUMBER OF EDGES IS 2, ONE CAN SIMPLY ELIMINATE THE NODE, AS IN THE FOLLOWING EXAMPLE:

FROM THE STANDPOINT OF A KNOT DIAGRAM, THIS IS SIMPLY THE CIRCLE, LOOP, OR UNKNOT.

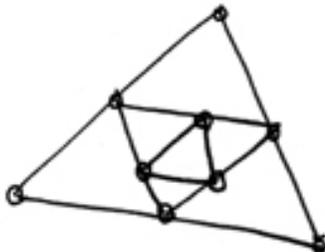

IF THE NUMBER OF EDGES IS 4, ONE CAN CONVERT THE NODE INTO A TRANSVERSAL CROSSING, THUS PRODUCING A KNOT DIAGRAM

THE TREFOIL

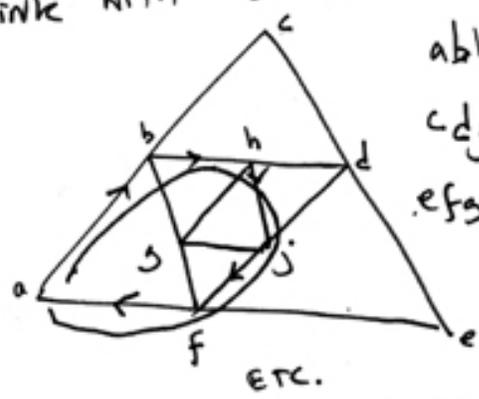

Eliminating the crossings and replacing them by nodes, converts the trefoil into a triangle intersected by an inscribed triangle. ^②

Let's continue the process.

Each 4-node is converted into a knot crossing by making a transversal connection of edges —

When this process is carried out consistently, one discovers that rather than a knot, one ends up with a link with 3 components:

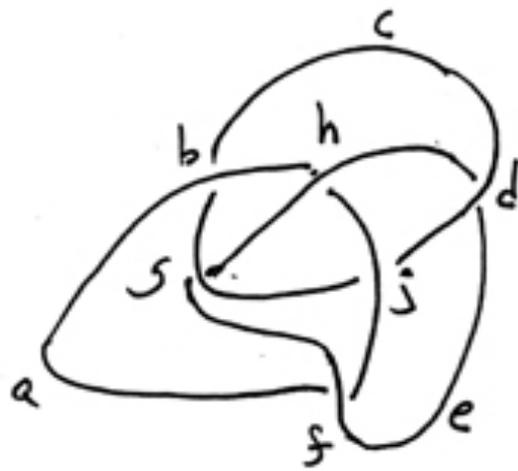

abhjfa
cdjgbc
efghde

ETC.

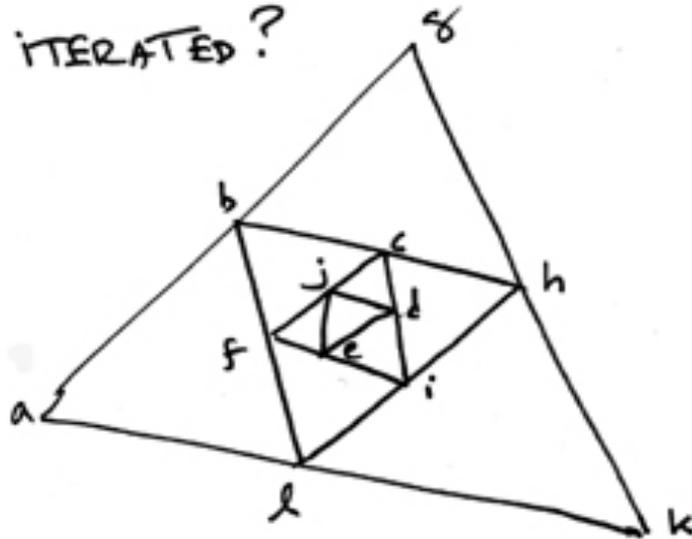

With the appropriate over- and under-crossings, this is the Borromean Rings Diagram

Wherefore art thou, oh Borromeo!

QUESTION: WHAT HAPPENS WHEN THE PROCESS IS ITERATED?

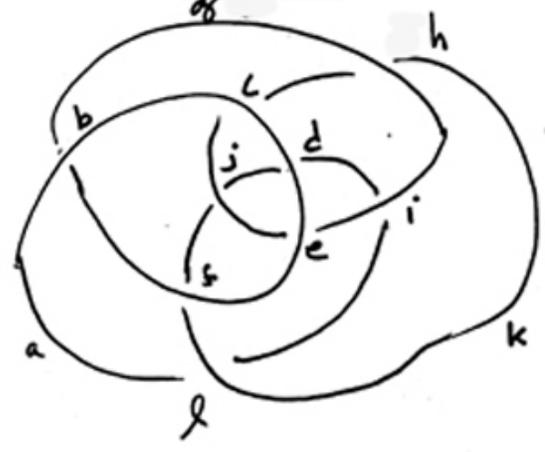

CALL THIS "STAGE 4"

THE RESULT IS, ONCE MORE, A KNOT DIAGRAM THAT MIGHT BE CALLED AN "ENTWISTLED TREFOIL". SIMPLY FOLLOW THE LETTERS AROUND. THE CORRESPONDING

UNKNOT Looks like this:

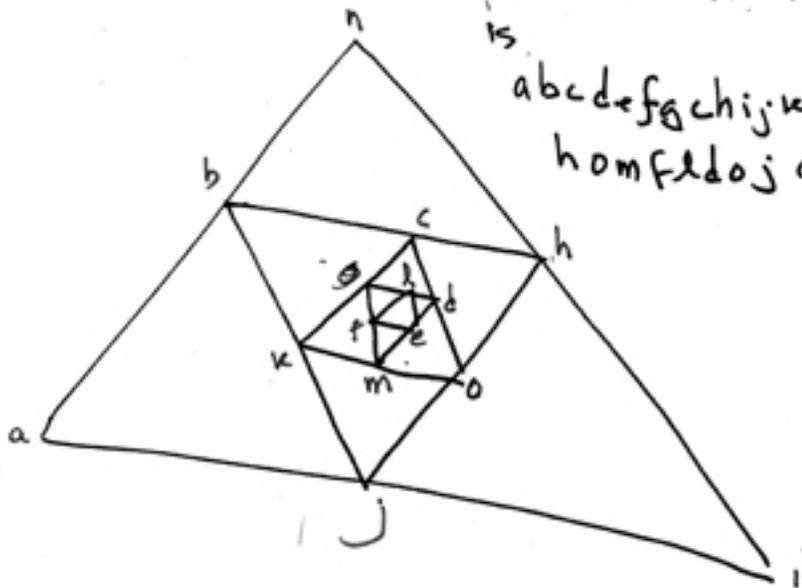

(4)

5

STAGE 5

THE ORDER OF CROSSINGS
IS
abcdefghijklmkn
hmfldoja

STAGE 5 IS ANOTHER KNOT DIAGRAM!

STAGE 6

STAGE 6 IS ONCE MORE A LINK
WITH 3 COMPONENTS —

⑥

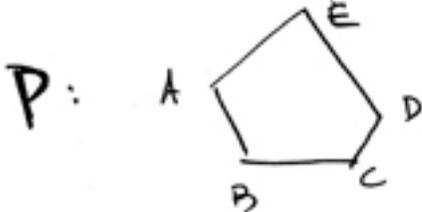

What is The general rule?

Prove it! (It's rather cute)

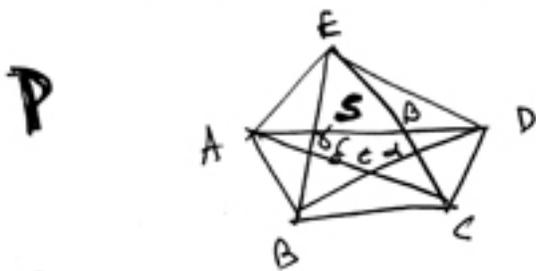

Observations on Knots and Polygons ⑦

II: The Pentagon

Let P be a convex pentagon

Connect the vertices to form an interior star, S

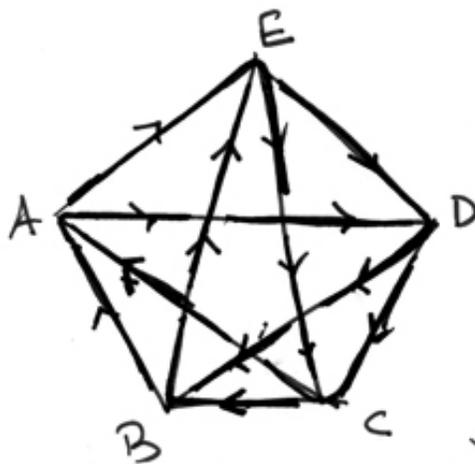

There are 4 lines joining each vertex. If the vertices are considered to be crossings, one has a knot diagram consisting of 5 exterior and 5 interior crossings —

This may be the diagram of a knot, or the diagram of a link with several components —

This is an unknot wrapped about to form a pentagon with interior star -

(b) Alternative under- and over-crossings.
 This forms a knot with analogies to the trefoil

Here is a feedhand version of this knot.

THE "PENTAFOIL"

Observe that the pentagon is
the only polygon that can be interpreted
as a non-trivial knot diagram - when
all the vertices are connected, only the pentagon
has 4 lines meeting at a vertex, which can
therefore be interpreted as a crossing
